1

(a)

 $n \in \mathbb{N}$ then $2^n - (-1)^n$ is divisible by three. Let's check the first steps:

$$n = 1$$
 $2^{1} - (-1)^{1} = 3$
 $n = 2$ $2^{2} - (-1)^{2} = 3$
 $n = 3$ $2^{3} - (-1)^{3} = 9$
 $n = 4$ $2^{4} - (-1)^{4} = 15$

All of the first n's are divisible by three. We go to general form:

$$n$$

$$n+1$$

$$2^{n}-(-1)^{n}$$

$$2^{n+1}-(-1)^{n+1}$$

$$=2(2^{n})-(-1)^{n+1}$$

$$=2(2^{n}+(-1)^{n}+(-1)^{n+1})-(-1)^{n+1}$$

$$=2(2^{n}+(-1)^{n}-(-1)^{n})-(-1)^{n+1}$$

$$=2(2^{n}-(-1)^{n})+2(-1)^{n}+(-1)^{n}$$

$$=2(2^{n}-(-1)^{n})+3(-1)^{n}$$

Notice that the expression for n+1 is made up by a two part. The first is 2 times the n expression and the second part is 3 times either -1 or +1. Both part are divisible by 3 and there by is the product divisible by 3.
